ScanPlus®

Mobile Device Management

ScanPlus - Mobile device management (MDM), is a security solution that enables enterprise administrators to discover, monitor, control, secure, and implement policies on Smartphones and Tablets. MDM intends to optimize the functionality and increase the efficiency and security of such mobile devices within the enterprise while simultaneously safeguarding the corporate network. With the increased rate of technological developments, more organizations resort to MDM, to secure these devices across networks, and increase productivity.

ScanPlus®

Mobile Device Management | Functions

- Mobile device management relies on endpoint software called an MDM agent and an MDM server that lives in a data center, either on-premises or in the cloud.
- IT administrators configure policies through the MDM server's management console.
- The server pushes those policies over the internet to the MDM agent on the device.
- The agent applies the policies to the device by communicating with application programming interfaces (APIs) built directly into the device operating system.
- Similarly, IT administrators can deploy applications to manage devices through the MDM servers.

ScanPlus®

Mobile Device Management | Features

- **Silently** install, update, and uninstall applications
- Manage application **permissions**, including access to camera and SD card
- Adjust multiple **device settings** (GPS, Bluetooth, Wi-Fi)
- **Device Health information** (i.e., network and battery traffic)
- **Security** - The MDM platform can protect the device against unauthorized usage, sets up the requirements for PIN code protection, and secures the network connection.

ScanPlus®

Mobile Device Management | Features

- **Software update** - Corporate applications aren't usually distributed through Google Play to avoid unauthorized usage. Keeping the software up-to-date is a nuisance for every IT manager. The ScanPlus MDM platform keeps apps updated on managed devices.
- **Remote Support** - The ScanPlus MDM platform simplifies resolution by providing tools for remote support and debugging.
- **Management** - The ScanPlus MDM software may display the user's location and availability to verify proper usage of the mobile device.
